Phase 17 deploy checklist (subscription marking)

Do these in order. The pre-deploy gate (`deploy-guard`) said GO on 16 Oct 2026, on one condition: the database update (step 2) must go in before the server deploys (step 4). Deploying the server first would break the Subscriptions page.

1. Check first (read-only)

Supabase → your Trim project → SQL Editor → New query. Run:

```
select conname, pg_get_constraintdef(oid)
from pg_constraint
where conrelid = 'public.recurrences'::regclass and contype = 'c';
```

It must list a rule named exactly `recurrences_interval_check` (allowing `monthly` and `weekly`). If the name is different, stop and tell Claude. Then run this and write down both numbers:

```
select count(*) as total,
       count(*) filter (where cancelled_at is null) as active
from public.recurrences;
```

2. Apply the database update

Open `server/migrations/017a_subscription_tracking.sql` in the repo, copy all of it, paste it into a new query and click Run. You should see “Success. No rows returned”. It is safe to run twice. Do not run 012, 018, 018a or 019.

3. Check after (read-only)

Run the first query from step 1 again. Expect three rules: `recurrences_amount_check`, `recurrences_interval_check` (now also allowing `annual`) and `recurrences_next_run_required`. Then:

```
select count(*) as total,
       count(*) filter (where auto_log) as auto_log_true,
       count(*) filter (where next_run_at is null) as null_next
from public.recurrences;
```

Expect: `total` the same as in step 1, `auto_log_true` equal to `total`, and `null_next` = 0.

4. Merge and deploy

Merge `feature/subscription-marking` into `main` (it fast-forwards), then use the `/deploy` skill: server (trim-api) first, then the client. After the server deploys, check that `/api/health` answers 200 and that `/api/subscriptions` without logging in answers 401.

5. Try it, logged in

- Subscriptions loads with no error; your Repeat-this items show “Logs itself”.

- Transactions → pencil on any expense → the Subscription section appears → “This is a subscription”.
- Subscriptions → Add a subscription.
- Quick Add with “Repeat this” ticked still saves.

6. Next morning

Vercel → trim-api → logs. Find the 03:00 UTC `[cron:recurrences]` line and check `errors` is 0. Nothing alerts you if the nightly job fails, so this check is the only way to find out.

If something goes wrong

In Vercel, promote the previous client deployment and the previous trim-api deployment. Leave the database update in place: the old server code works with it. Never undo the database change while the new server is live.
